your IoT dreams and
nightmares.

Did you hear about the IoT Botnet?

Twitter, Spotify, Github, and other popular websites became unavailable recently when a botnet of IoT devices (mostly webcams and DVRs) targeted their DNS service Dyn. A similar botnet was used in September in a massive attack against security researcher Brian Krebs. Some of the IoT devices were compromised because they had a hard-coded admin password, and have since been recalled.

IoT & Surveillance

“ In the future, intelligence services might use the [Internet of Things] for identification, surveillance, monitoring, location tracking, and targeting. ”

– U.S. Intelligence Chief James Clapper
